Being healthy means optimizing all aspects of well-being, including physical, mental, and social well-being.\(^1\) Health is influenced by a variety of personal, social, economic, and environmental factors called ‘determinants of health’,\(^2\) such as our genetics, behaviors, where we live, and accessibility to health care. The determinants of health are inter-related, whereby changes in one determinant impact other determinants. As such, interventions and policies that target more than one determinant will have greater impact on our health.\(^2\)

Oklahoma has historically ranked poorly in many key health indicators. The United Health Foundation ranked Oklahoma’s overall health in 2016 as 45\(^{th}\) in the United States in their annual America’s Health Rankings report.\(^3\) Most of the indicators in the report relate to conditions that Oklahomans live with every day, such as poverty and limited access to primary care. The report cited Oklahoma’s high prevalence of smoking, uninsured, and premature death rate as some of the state’s biggest challenges. Such conditions, along with risky health behaviors like smoking and physical inactivity, contribute to the poor health status of Oklahomans.

Recently, Oklahoma has experienced improvement in some key areas. Despite still having high prevalence of smoking, the rates have declined significantly over the past few years.\(^4\) The rate of teen births has declined 39% in 6 years,\(^5\) and the rate of infant deaths remains lower than it was in 2000.\(^6\) The Oklahoma Health Improvement Plan (OHIP) encourages Oklahomans to work together across multiple health care systems to strengthen resources and infrastructure, enabling sustainable improvements in health status.\(^7\) Every small step forward is progress leading to a #HealthierOK!

County Spotlight

Scale: 1 (best) – 77 (worst)

Compared to all other Oklahoma counties, Bryan County ranks:

- 2nd for minimum daily vegetable consumption (2013)
- 5th for infant mortality rate (2011-2015)
- 8th for minimum daily fruit consumption (2013)
- 15th for percent of population with diabetes (2015)
- 16th for percent of obese population (2015)

About Bryan County:

Bryan County is named after Democratic presidential candidate and Oklahoma Constitution contributor William Jennings Bryan. Bryan County land was first occupied by Choctaw Indians in the early 1830s, followed by Chickasaw tribes after their removal from the South in the late 1830s. The arrival of the first north-south railroad, the Missouri Kansas and Texas Railway, in the early 1870s allowed for towns to be established nearby. At statehood, the county was officially established.

Fun Facts:

- Chief Wilson N. Jones was a wealthy rancher and store owner in the region and was nicknamed “cattle king” of the Choctaw Nation.
- Cotton once was a major cash crop for the county, but in 1927, boll weevils destroyed much of the cotton and the farmers had to turn to peanut production.
- In 1997, Bryan County was the 2nd most peanut-producing county in Oklahoma, 3rd for beef cattle, and 7th for pecan harvesting.
- German prisoners of war in World War II built the Denison Dam across the Red River, creating Lake Texoma.
- Southern parts of the county were popular for “beer joints” because across the river in Texas, alcohol sales were prohibited until the 1970s.
- The “war governor” Robert L. Williams hailed from Bryan County.
- In the 1930s, the four-story Bryan Hotel in Durant hosted Roy Acuff, Charles “Pretty Boy” Floyd, and Pinky Tomlin.
- Fort Washita is a National Historic Landmark.

DATA NOTE:

Multiple years of data are utilized in this report to create more stable estimates of health indicators for Oklahoma’s small populations. Trends and comparisons across groups are made when possible. Because the Behavior Risk Factor Surveillance System (BRFSS) data are not sampled at the county level, Health Care Information at the Oklahoma State Department of Health has created small area estimates through statistical modelling to enable discussion of county-level data. However, these small area estimates are not comparable to state and national data that are derived via the CDC’s standard weighting process. In addition, the CDC instituted new data weighting methodology for BRFSS data, rendering data prior to 2011 incomparable to data for 2011 and later. Also note that some data are not available for every year.

- Transportation/material moving: 0.5%
While smoking rates continue to decline in the United States, tobacco is still the leading contributor of preventable deaths in the United States; a quarter of coronary heart disease deaths, 82% of lung cancer deaths, and 61% of pulmonary diseases are attributed to tobacco use.\textsuperscript{11} Oklahoma consistently has one of the highest rates of adult smokers in the country. The 2015 Oklahoma rate is higher than the 2015 national rate (15.1%), as well as the previous 2014 rate (22.3%).\textsuperscript{12,13,14} Fortunately, 52.7% of previous Oklahoma smokers have quit, which is similar to the national average of 58.8%.\textsuperscript{14}

Data from 2015 show that racial disparities do exist in tobacco use, with a higher percentage of Oklahoma American Indian adults smoking (32.5%) compared to Black (25.0%), White (21.4%), and Hispanic (17.1%) adults.\textsuperscript{14} Additionally, young adults (aged 25-34 years, 27.6%) comprised the highest percentage of smokers in the Oklahoma population, as well as males (24.0%) compared to females (20.4%).\textsuperscript{14}

Attributable expenses for smoking in for the state in 2009, the most recent year for data, was $1.62 billion, including ambulatory, hospital, prescription drug, and nursing home expenses, but excluding dental expenditures.\textsuperscript{15} From 2005-2009, 7,490 deaths were attributable to smoking in Oklahoma.

Of concern are other types of tobacco use, such as smokeless tobacco and now e-cigarettes. Almost 7% of Oklahoma adults use smokeless tobacco products, with almost 70% of smokeless tobacco users also being smokers. E-cigarettes usage has also increased among tobacco users of all ages, both nationally and at the state-level.\textsuperscript{16,17} For example, 19% of Oklahoma high school students used e-cigarettes in 2015, dramatically increased from 6.3% in 2013.\textsuperscript{18}
Obesity is a primary cause of adult deaths and is defined as having a BMI greater than 30.0 kg/m² (BMI = weight in kg/square of height in m). In addition to its association with mortality, obesity increases risk for several chronic diseases such as heart disease and type 2 diabetes. Unfortunately, obesity rates have continued to rise in Oklahoma. Thirty-four percent of adult females and 33.7% of adult males in Oklahoma were obese in 2015, and nearly half of American Indian adults were obese, followed by Black (36.9%), White (32.9%), and Hispanic (32.0%).

Additionally, obesity continues to be a problem for youth in Oklahoma. Nearly 14% of 2- to 4-year-old WIC participants were obese from 2000–2014, as well as 17.4% of 10- to 17-year-olds in 2011. Data from the Youth Risk Behavior Surveillance System (YRBSS) show that 15.4% of high school students self-reported obesity from 2011-2015. More male (18.1%) than female (12.8%) students were obese.

Medical costs for obese individuals were estimated to be $2,741 higher than per capita spending for normal weight individuals in 2005, and this economic burden can be expected to increase as the cost of health care increases.
Of Oklahoman mothers giving birth from 2011-2015, 58% were married; in Bryan County, 52.9% were married. Two percent of mothers giving birth in the county had gestational diabetes, which is lower than the state average of 4.1%. Additionally, 19.8% of live births in the county were to mothers who smoked during pregnancy, which is higher than the state’s average of 13.5%.²⁵

Low Birth Weight

Low birth weight (i.e., weighing fewer than 5 pounds and 8 ounces, or 2500 grams) and preterm births (i.e., 37 weeks of gestation or less) together are the second leading cause of death among children less than 1 year of age.²⁶ Low birth weight infants are more at risk of health problems compared to infants born of normal weight, including infection, gastrointestinal problems, delayed motor and social development, and learning disabilities. Low birth weight infants may also be at higher risk of high blood pressure, diabetes, and heart disease later in life.²⁷

The state rate is the same as the latest national data (8.1% in 2015).²⁷ When considering race from 2011-2015, Oklahoman Black babies were more likely to be of low birth weight (13.4%) compared to White (7.5%), American Indian (7.0%), and Asian (7.8%) babies.²⁵
Infant Mortality Rate

The infant mortality rate (IMR) is an important indicator of the health of a nation and is also a reflection of maternal health, accessibility and quality of primary health care, and the availability of supportive services in the community. The leading causes of infant death include congenital malformations (i.e., medical conditions present at birth), disorders related to short gestation (fewer than 37 weeks of pregnancy completed) and low birth weight (less than 5 lbs., 8 oz.), and Sudden Infant Death Syndrome (SIDS).

Oklahoma’s 2011-2015 IMR, although slightly lower than its previous 2006-2010 rate of 7.6 deaths per 1,000 live births, has resulted in 147,075 years of potential life lost from 2011-2015, based on an average age of death in Oklahoma of 75 years. The rate is also still significantly higher than the national rate of 6.0 infant deaths per 1,000 live births in 2013. Further, racial disparities exist in IMR, with Oklahoma’s Black infant rate more than double the rates of White and Asian infants. The IMR for Black infants declined between 2006-2010 estimates and 2011-2015 estimates (15.6 to 14.5, respectively), but is still extremely high.

Bryan County’s IMR is 25.7% lower than the state rate and 34.2% higher than the county rate from 2006-2010 (4.1 deaths per 1,000 live births). Additionally, the IMR rate was highest for White (4.3 deaths per 1,000 live births), which is slightly higher than 2006-2010 rate of 4.0 deaths per 1,000 live births. Other race and ethnic rates could not be computed.

While organizations across Oklahoma have been working together to reduce infant mortality as part of the Preparing for a Lifetime, It’s Everyone’s Responsibility initiative, there is still much work to do. One way to reduce infant mortality is through receiving prenatal care in the first trimester, which is believed to reduce the risk of maternal and infant sickness and death as well as preterm delivery and low birth weight. From 2011-2015, 71.1% of women who had a live birth in Bryan County accessed prenatal care during the first trimester of their pregnancy.

1,200

Years of Potential Life Lost
Bryan County, 2011-2015

Based on an average death in Oklahoma of 75 years
Teenage Pregnancy

Although births to teen mothers have been declining in recent years, Oklahoma still has one of the highest teen birth rates in the country (ranked at 48th in the nation), including a high rate of repeat births. Pregnant teens are more likely than older pregnant females to experience medical complications, have low educational attainment, and engage in unhealthy behaviors that put their unborn child at risk. Children of teen mothers are more likely than children of older mothers to display poor health and social outcomes, such as premature birth, low birth weight, behavioral problems, and abuse and neglect. Additionally, infant mortality rates are highest for babies of teen mothers.

Bryan County’s teen birth rate is 21.6% higher than the state rate and 130% higher than the 2015 national rate of 22.3. The current county rate is 25.8% lower than the 2005-2009 rate. The majority of births in Bryan County to teen mothers are first births (76.1%), while 21.1% are second births, and 2.8% are the third or more births.

Recent estimates place the cost of teen childbearing in Oklahoma at $169 million in 2010, and this includes only health care and other costs associated with the children, not the mothers.
From 2013-2014, nearly 20% of adult Oklahomans had a mental illness and 4.4% had a serious mental illness. This is similar to the national rates for the same time period of 18% and 4.2%, respectively. Further, it is estimated that 3.9% of Oklahoman adults had thoughts of suicide from 2013-2014; this rate is the same as the national rate. What is even more troubling is that only 42% of Oklahoman adults with a mental illness had received treatment or counseling from 2010-2014.39

Adolescents are not spared from mental illness either. From 2013-2014, one in ten Oklahoman adolescents (compared to the 11% national average) experienced a major depressive episode and of those, over half did not receive any treatment for depression.39 Unfortunately, 2015 data show that 15.1% of high school youth seriously considered attempting suicide and 7.4% attempted one or more times.23

Substance use and abuse is also a problem among both adolescents and adults. From 2013-2014, 8.1% of adolescents in Oklahoma had used illicit substances in the past 30 days (national average: 9.1%), and 5.3% of Oklahoman adolescents used pain relievers for nonmedical use (national average: 4.7%). Two percent of Oklahomans 12 years and older were dependent on or abused illicit drugs (national average: 2.6%), and of those with a dependence/abuse problem, 85% did not get any addiction treatment (2010-2014). Further, from 2013-2014, 6.4% of Oklahomans over 12 years of age had alcohol dependence or abuse (national average: 6.5%). Of those, 92.8% did not receive treatment (2010-2014).39

Oklahoma hospital inpatient discharge data for 2014 show 19,352 discharges related to mental illness, with an average stay of 10.8 days. In Bryan County, 94 discharges were for mental illness, costing $3,127,891 total. The average length of stay was 16.1 days. Slightly more female than males were discharged, but females had a shorter average length of stay than males (14.3 and 18.4, respectively).40

The Oklahoma suicide rates are highest for men, 45-54 year-olds, and White individuals. The highest rates for Bryan County were for males, ages 45-54 (37.2 deaths per 100,000 population), and White individuals. Additionally, ages 35-44 (31.4), and 25-34 (20.5) were high.29 Other race and ethnic rates could not be computed.

Oklahoma, 2014
In 2015, 41.9% of Oklahoman adults had at least one drink of alcohol in the past month, lower than the national average of 53.6%. This percentage has slowly decreased since 2011, both at the state and national level. Binge drinking (five or more alcoholic beverages on one occasion for men, four or more for women), however, continues to be an occurrence for many adult Oklahomans. Unlike the decreases in monthly use of alcohol, engagement in binge drinking has increased slightly since 2013 at the county level, while remaining steady at the state and national levels.¹²

Oklahoma high school youth also admit to alcohol use. Fifteen percent drank alcohol before the age of 13 (highest for American Indian and Hispanic males), 27.3% consumed one or more drinks in the past month (highest for Hispanic and White males), and 5.8% had 10 or more alcoholic drinks in a row (highest for males). Further, nearly half had alcohol given to them (highest for White and Hispanic females).²³

STATE OF THE COUNTY’S HEALTH REPORT

Page 11
Nutrition and Physical Activity

Poor diet is a primary cause of adult deaths in the U.S. While poor diet can be characterized in many different ways, a common proxy measure is assessing fruit and vegetable consumption. A recent study determined that fruit and vegetable consumption is associated with reduced risk of death. Oklahoma has typically ranked as one of the worst states for fruit and vegetable consumption among adults. In 2013, the last year data were available for every state, Oklahoma ranked second to last in consuming three daily servings of vegetables and third to last in consuming two or more daily servings of fruits.

</tbody>
</table>

Physical Activity

Physical inactivity was reported to be a leading contributor to almost 1 in 10 adult deaths in the U.S. In 2014, close to 24% of U.S. adults did not engage in any physical activity. Adults who engage each week in 150 minutes of moderate to vigorous intensity aerobic activity in bouts of at least 10 minutes experience improved health and fitness and reduced risk of several chronic diseases.

Youth who are regularly active have a better chance of having a healthy adulthood. Children and adolescents should get at least 60 minutes of moderate intensity physical activity most days of the week, preferably every day, and three of those days should include vigorous intensity aerobic activity. Statewide from 2013-2015, 53.8% of high school students were physically active for one hour at least five days of the week.
Diabetes

Type II Diabetes Mellitus is a chronic disease characterized by high levels of sugar (i.e., glucose) in the bloodstream due to the body’s resistance to insulin. If left untreated, serious complications can arise, including heart disease, renal failure, retinopathy, and neuropathies. Several risk factors may increase the likelihood of developing diabetes. Some of these risk factors cannot be changed (e.g., aged 45 years and older, family history). Other risk factors relate to behaviors, such as prediabetes, overweight/obesity, being physically inactive, and having high blood pressure.47

The American Diabetes Association released a report estimating the total cost of diagnosed diabetes to be $245 billion in the U.S. in 2012.48 This amount includes both direct medical costs and reduced productivity. They estimated the largest component of direct medical costs to be hospital inpatient care.

Oklahoma | Bryan County

Adults Diagnosed with Diabetes

2015

103 Hospital Discharges | $4,915,416 Total Charges | 3.8 days Average Hospital Stay | $47,722.92 Average Charges per Stay
**Leading Cause of Death**

In Bryan County, heart disease is the leading cause of death for all ages combined at 248.8 deaths per 100,000 population (2011-2015). The rate increased 0.6% from the previous 2008-2012 data (247.3 deaths per 100,000 population). In 2014, the most recent year for which hospital discharge data are publicly available, the total charges attributable to heart disease in the county were $38,999,084, or $78,945.5 per discharge.

**Injury and Violence**

Unintentional injury is the 5th leading cause of death in Oklahoma, and the leading cause of death among individuals aged 5-44 years. In 2014, the most recent year that data are publicly available, injuries and poisoning accounted for 36,984 total discharges, costing $2.1 billion of Oklahoma’s hospital inpatient charges, or $58,543 per discharge. This equates to 12.7% of total inpatient charges in 2010, and does not consider other related medical expenses or lost productivity.

From 2011-2015, unintentional injury was the 4th leading cause of death for Bryan County and is higher than the 2006-2010 rate (65.5).

**Motor-vehicle Death Rate**

Motor-vehicle accidents account for 30.2% of Bryan County’s total unintentional injury deaths. In 2013, motor vehicle crashes cost Oklahoma an estimated $8 million in medical costs and $894 million in work loss costs, resulting in a total cost of $902 million. This cost includes wage and productivity losses, medical expenses, administrative expenses, motor vehicle damage, and employers’ uninsured costs.
Violence-related deaths, like suicide and homicide, are also leading causes of death in Oklahoma.\textsuperscript{29} Bryan County’s homicide rate of 5.5 deaths per 100,000 population is 23.6\% lower than the state rate of 7.2 deaths per 100,000 population.
The top 10 leading causes of death table displays a broad picture of the causes of death in Bryan County. Since many health-related issues are unique to specific ages, this table provides causes of death by age group at a glance. The causes of death that are present across almost every age group have been highlighted. This table shows the actual number of deaths by cause.

*Total deaths per age group were determined and cause of death was ordered (by frequency) when 5 or more deaths occurred for a specific cause; the number of deaths that occurred in frequencies fewer than 5 per cause were not included because the data are suppressed on OK2SHARE (the source of this data) when there are fewer than 5 deaths per search category.

**Notes:**
- Red = Have not yet met 2020 Target
- Green = Exceeded 2020 Target
- Black = Same as 2020 Target

*Death rate is age-adjusted to the 2000 U.S. standard population; §The most recent data available from CDC WONDER Natality Data shows that 65.4%<sup>52</sup> of women having live births in from 2011-2015 received prenatal care within the first three months of pregnancy. Not all states collect prenatal care information on the birth certificate.

**County Health Department Usage**

There are 82 county health department sites in 68 counties across Oklahoma which are part of the state system, and 2 independent health departments (Oklahoma City-County and Tulsa City-County Health Departments). In the 7 counties without a physical site, staff from neighboring counties provides specific services to those regions, and residents can visit health departments in neighboring counties for additional services. Each department offers a variety of services, such as immunizations, family planning, maternity education, well-baby clinics, adolescent health clinics, hearing and speech services, child developmental services, environmental health, health education, community development programs, and the SoonerStart program. Not every service is available in all counties.

The data on this page reflects services provided in the county health department. Other activities are implemented across the county and in the community to promote the public’s health.

**TOTAL VISITS: 12,530**  
**TOTAL CLIENTS: 4,796**
Access to Care

In 2014, Oklahoma ranked 48th in the nation for the number of primary care physicians per 100,000 population (84.8) and nearly 25% of Oklahoma adults do not have a personal doctor or health care provider. Further, 70 out of the 77 counties are considered to be medically underserved areas (MUA). Although 86.4% of adults over 18 had health care coverage in 2015, 15.2% reported that within the past year, they could not visit a doctor due to cost.
