Oklahoma ranks near the bottom in many key health status indicators. Most of these outcomes are related to conditions that Oklahomans must live with every day. Poverty, lack of insurance, limited access to primary care, and inadequate prenatal care, along with associated risky health behaviors (low fruit/vegetable consumption, low physical activity, a high prevalence of smoking) all contribute to the poor health status of our citizens.

The vision of the Oklahoma Health Improvement Plan (OHIP) involves local partnerships and communities working together to improve and sustain the physical, social, and mental well-being of all people in Oklahoma. The targeted flagship initiatives of children’s health improvement, tobacco use prevention, and obesity reduction will help to maximize opportunities for all Oklahomans to lead healthy lives. If you would like more information about OHIP, please visit the Oklahoma State Department of Health website at http://www.ok.gov/health/Organization/Board_of_Health/OHIP.html.

This report focuses on health factors and demographics in Tulsa County. Awareness and thoughtful application of this health data can assist us in our joint endeavors to improve the health status of our local citizens.
County Demographics

Population estimates\(^1\)
- 11.6% increase from 1990 to 2000 (505,289 to 563,819)
- 5% increase from 2000 to 2008 (563,819 to 591,982)
- Ranked 16th for growth in state

2008 Census Estimates\(^2\)
- Hispanic/Latino ethnicity = 9.9%
- Race
  - Whites = 79.5%
  - Native Americans = 5.7%
  - Blacks = 12.4%
- Age
  - Under 5 = 8.1%
  - 65 and over = 12.1%
  - Median age = 34.4 years
- Housing units
  - Occupied = 226,892 (93%)
  - Vacant = 17,061 (7%)

- Disability (ages 21 to 64) = 19.1%
  - state = 21.5% national = 19.2%
- 60.4% of disabled (ages 21-64) are employed
- Individuals below poverty = 11.6%
  - state = 14.7% national = 12.4%
- Families below poverty = 8.7%
  - state = 11.2% national = 9.2%

Top 10 Leading Causes of Death

The top 10 leading causes of death\(^4\) table on the next page displays a broad picture of the causes of death in Tulsa County. Since many health-related issues are unique to specific ages, this table provides causes of death by age group at a glance. The causes of death that are present across almost every age group have been highlighted. From 1983 to 1993 heart disease killed 1,129 people in Tulsa County and is still the leading cause of death with all age groups combined.

From 2006-2008, the total charges for all heart disease-related hospitalizations for Tulsa County residents was $710,521,469.00, which translated to an average of $33,237.66 per discharge.\(^5\) Total charges are an indicator of community health, however, these are hospital-based charges and not payments or costs of actual illness. The direct and indirect costs of disease are actually much higher (i.e., loss of employee wages, loss of tax revenue, loss of years of life).

Data source: Vital Statistics, Health Care Information Division, Oklahoma State Department of Health

Produced by: Community Development Service, Oklahoma State Department of Health

March 2009
**Nutrition & Overweight**

With obesity at epidemic levels, steps need to be taken to control this issue. Surveillance systems have improved and been expanded to obtain more accurate county-level data. While efforts continue on this front, communities must utilize this information to improve the problem itself. With health care costs being, on average, $395 more for a person under the age of 65 who is obese than a person of the same age who is not obese, estimated health care costs related to obesity for Tulsa County soar to almost $40.9 million. These costs only go up when the 65 and over population are included.

The Youth Risk Behavior Surveillance System (YRBS), while not producing county-level data, shows that in 2005, 2007, and 2009 combined, 15.8% of high school children participating in the survey classified themselves as overweight. Further, 14.7% classified themselves as obese. Interestingly, 8.9% of the males said they were obese compared to 5.8% of females. This trend was reversed in the overweight category with 8.0% of females and 7.8% of males, statewide. Although, neither weight category is statistically significant by gender.

According to the Behavioral Risk Factor Surveillance System (BRFSS, 2003 & 2005), 84.3% of Tulsa County adults did not eat the recommended 5 servings of fruits and vegetables a day. Increasing fruit and vegetable consumption is an economical way to control many health-related issues such as obesity and diabetes.

**Physical Activity & Fitness**

The increasing inactivity of the U.S. population is contributing to an increase in numerous poor health-related outcomes. Physical inactivity robs the body of precious energy needed to function properly, in turn health declines, and rates of various chronic diseases escalate.

According to the 2003-2008 BRFSS, it is estimated that 26.8% (112,921) of people in Tulsa County had no leisure activity in the past month (at the time they were surveyed) and over two-thirds of the adults (66.8%) did not reach the recommended physical activity level.

Statewide, 55% of high school students did not participate in physical activity for at least 60 minutes per day on five or more days in a week. Efforts need to be made to increase physical activity for our youth to build long-term healthy habits.

</tbody>
</table>

* Note: Data classified by Quartiles
Diabetes

As stated previously, poor nutrition and lack of physical activity are linked to many chronic issues including diabetes. It is often hard to distinguish between Type I and Type II diabetes in large datasets but looking at the overall impact of diabetes is necessary to examine a community’s health.

From 2006 to 2008, there were 3367 hospital discharges for diabetes among Tulsa County residents. This accounted for a total of 17,507 days in the hospital and $65,065,247.00 in total charges. This was an average of 5.2 days and $19,324.40 in charges.

According to the 2004-2008 BRFSS, it is estimated that 8.7% (36,657) of Tulsa County citizens have been diagnosed by a health professional as having diabetes.

In 2007, the per capita annual healthcare costs for people with diabetes was $11,744 compared to $5,106 for people without diabetes. Persons with diabetes accumulate an estimated $485,452,306.07 in health care costs in one year for Tulsa County. Actual hospital charges account for only 4.8% of the total health care impact of diabetes.

Teen Births

While births to teen mothers (age 15 to 19) have been on the decline in both the U.S. and Oklahoma, Oklahoma has moved down in the rankings according to the United Health Foundation. In 1993, the rate for teen births in the U.S. was 60.3 per 1,000 15-19 year old females and 67.1 in Oklahoma, ranking 35th in the country. In 2003, the rate decreased to 47.7 in the U.S. and 59.7 in Oklahoma, accounting for a decrease of 21% and 11%, respectively. However, while the rate decreased, Oklahoma continued to fall in the rankings (41st). In 2009, the rate of teen births stayed the same for Oklahoma (59.6) but the state ranked 45th in the country.

Children of teen mothers are more likely to display poor health and social outcomes than those of older mothers, such as premature birth, low birth weight, higher rates of abuse and neglect, and are more likely to go into foster care or do poorly in school.

According to Oklahoma Vital Statistics, Tulsa County had a teen birth rate of 61.5 in 2007, which accounted for no change from 2003 (61.4) and a 12% decrease from 1993 (70.2). The map represents a five-year average of teen birth rates, 2003-2007.

On average in Oklahoma, births to teen mothers accumulate $3,807 a year for each teenage birth, which is often passed on to citizens. With an average of 1,118.8 births per year (2003-2007), teen pregnancy costs the citizens of Tulsa County $3,580,160.00 a year.
Infant Mortality

Protecting the most vulnerable populations is a task for every Oklahoman, socio-demographic variables have repeatedly been shown to affect infant mortality and birth weight. Income, education, race/ethnicity, access to medical care and social services, and social support are just a few of the characteristics that alter these rates, both positively and negatively.16 Differences in infant mortality rates are most apparent within racial categories. From 2003-2005 within the U.S., the infant mortality rate among white mothers was 5.7 deaths per 1,000 live births, while black or African American mothers had an infant mortality rate of 13.3 and American Indian mothers a rate of 8.4. Interestingly, Hispanic mothers had rates similar to white mothers.15

Within Oklahoma, this trend continues. From 2002-2006, the infant mortality rate was highest for black or African American mothers (16.0), followed by American Indian (8.4), White (7.1), and Asian (5).4 The Hispanic infant mortality rate was 7.9.3

With an average of 412 infant deaths a year across Oklahoma4, it is difficult to obtain stable county-level data by race. From 2002-2006, the overall infant mortality rate for Tulsa County was 8. This accounted for a 0% did not change from the state rate of 8.0 deaths per 1,000 live births.4

In addition, the infant mortality rate in Tulsa County accounted for 28,050 years of potential life lost based on an average age of death in Oklahoma of 75 years of age.4

Low Birth Weight

Birth weight has been a long standing indicator of long-term health outcomes as birth weight has been linked to certain adult chronic conditions such as high blood pressure, Type II diabetes, and heart disease.17 Low birth weight is defined as any baby born weighing less than 2,500 grams or 5 pounds and 8 ounces (including very low birth weight = less than 1,500 grams/3 pounds, 5 ounces).17 Low birth weight is associated with premature births, multiple births, birth defects, chronic health problems or infections in the mother, smoking, alcohol or drug use, placental problems, inadequate maternal weight gain or socioeconomic factors.17 Understanding the trends behind low birth weight can assist in pinpointing causes specific to a community.

In Oklahoma from 2003-2007, 8.1% of the live births were less than 2,500 grams. As with infant mortality, babies born to black or African American mothers have the highest rates of low birth weight (14.1%), followed by White (7.5%), American Indian and Asian (6.9% each).12 This trend is similar to the national data.18

In Tulsa County, from 2003-2007 the low birth weight rate was 8.2%.12 This was a 1% increase from the state and national low birth weight rate. Because of the small numbers that occur in this category, county level data by race is unavailable.
Injury and Violence

Across the nation and the state of Oklahoma, unintentional and violence-related injuries are on the rise. Unintentional injuries account for the 5th leading cause of death in the United States and Oklahoma for 2002-2006. For persons ages 1 to 44 in Oklahoma, unintentional injuries are the leading cause of death.4

This trend does not change much in Tulsa County. Unintentional injuries are the leading cause of death for ages 5 to 44 in Tulsa County.

It is estimated that for every motor vehicle-related death $1.3 million in economic costs are incurred (2008 data).16 For Tulsa County, which has an average of 86.0 motor vehicle-related deaths a year4, the estimated economic costs are almost $111.8 million a year.

Violence-related injuries (homicide and suicide) in Tulsa County are ranked in the top 10 causes of death for persons from 5 to age 64 and suicide is the 9th leading cause of death for all ages.4

Tobacco Use Prevention

According to the 2005 State of the State’s Health Report19, tobacco use among Oklahomans has remained fairly stable from 1990 to 2002. The good news is that total cigarette sales in Oklahoma (tribal and non-tribal combined) have dropped from 98.2 packs per capita in fiscal year 2005 to 86.7 packs per capita during fiscal year 2008. The national average dropped during this same time period.20

Tobacco use is no longer just the problem of the individual but also the community as a whole. With health care costs on the rise, targeting areas such as tobacco use is an effective way to control those costs. The Oklahoma Tobacco Helpline (1-800-QUIT-NOW), supported jointly by the Oklahoma Tobacco Settlement Endowment Trust and the Oklahoma State Department of Health, continues to experience high call volume. Over 37,800 Oklahomans received free cessation assistance through the Helpline in fiscal year 2009.20 Since inception of the Helpline in August 2003, over 110,000 Oklahomans have received free cessation assistance.20

The CDC estimated that a person who used tobacco accrued over $3,300 in health care costs per year.21 According to the BRFSS (2005-2009)8, it is estimated that 23.7% (99,859) of adults in Tulsa County use tobacco of some sort. Medical costs accumulated by those persons are over $329.5 million a year for Tulsa County.

Westside Community Coalition

Coalition Priorities:

1. Promote the health and safety of West Tulsa residents.
2. Foster cross-generational investment in the community within west Tulsa.
3. Provide support for the continuum of care for substance abuse prevention, treatment and aftercare.

2009 Significant Outcomes:

- Expansion of the coalition.
- Compiling community priority needs.
- Westside Harvest Market.
