Health on the Horizon

Noble County

Health is not simply the absence of disease. Health is comprised of our physical, mental, and social well-being, and is influenced by a variety of factors called ‘determinants of health’. These determinants include a range of personal, social, economic, and environmental factors, such as our genetics, behaviors, and access to health care. The determinants of health are inter-related; change in one area results in changes in other areas. As such, interventions and policies that target more than one determinant will have greater impact on our health.

Oklahoma has historically ranked poorly in many key health indicators. Most of these indicators relate to conditions that Oklahomans live with every day, such as poverty and limited access to primary care. Such conditions, along with risky health behaviors like smoking and physical inactivity, contribute to the poor health status of Oklahomans.

Recently, Oklahoma has experienced improvement in some key areas, such as infant health (lower rates of pre-term births and infant deaths) and smoking (lower prevalence of adult smokers). The Oklahoma Health Improvement Plan (OHIP) encourages Oklahomans to work together across multiple health care systems to strengthen resources and infrastructure, enabling sustainable improvements in health status. Health is on the horizon, and together we will Create a State of Health.
Rate should be used cautiously due to the large measurement error.

The top 10 leading causes of death table on the next page displays a broad picture of the causes of death in Noble County. Since many health-related issues are unique to specific ages, this table provides causes of death by age group at a glance. The causes of death that are present across almost every age group have been highlighted.

In Noble County, heart disease is still the leading cause of death for all ages combined. The rate declined 22.2% since the previous 5-year period, from 256.1 deaths per 100,000 population (2003-2007) to 199.2 deaths per 100,000 population (2008-2012). In 2010, the most recent year for which hospital discharge data are publicly available, the total charges attributable to heart disease in Noble County were $8.86 million, or $56,446.09 per discharge.

*Total deaths per age group were determined; cause of death was ordered (by frequency) when 5 or more deaths occurred for a specific cause; and the number of deaths that occurred in frequencies fewer than 5 per cause were groups together as “OTHER CAUSES.” Specific causes could not be determined for those deaths in “OTHER CAUSES” because the data are suppressed on OK2SHARE (the source of this data) when there are fewer than 5 deaths per search category.

Data source: Vital Statistics, Health Care Information Division, Oklahoma State Department of Health
Produced by: Community Epidemiology and Evaluation, Oklahoma State Department of Health
Nutrition and Obesity

Poor diet is a primary cause of adult deaths in the U.S. Poor diet can be characterized in many different ways, but a common proxy measure of poor diet is assessing fruit and vegetable consumption. A recent study determined that fruit and vegetable consumption is associated with reduced risk of death. Oklahoma has typically ranked as one of the worst states for fruit and vegetable consumption among adults. In 2009, the last year data were available for every state, Oklahoma ranked last in consuming 5 or more daily servings of fruits and vegetables. In Noble County, 8.0% of adults consumed the recommended servings of fruits and vegetables daily.

Obesity is also a primary cause of adult deaths. Obesity is defined as having a BMI greater than 30.0 kg/m² (BMI = weight in kg/square of height in m). In addition to its association with mortality, obesity increases our risk of several chronic diseases such as heart disease and type 2 diabetes. Obesity rates have skyrocketed in Oklahoma, with self-reported obesity prevalence at 32.2% among adults in 2012 and at 11.8% among high school students in 2013. Data from 2005-2010 estimate the rate of adult obesity to be 39.1% in Noble County (30.3% higher than the rate reported in the previous County Health Report). However, this rate should be used cautiously due to the large measurement error associated with the estimate. Medical costs for obese individuals were estimated to be $2741 higher than per capita spending for normal weight individuals in 2005, and this economic burden can be expected to increase as the cost of health care increases.

Physical Activity and Fitness

Physical inactivity was reported to be a leading contributor to almost 1 in 10 adult deaths in the U.S. Close to 23% of U.S. adults do not engage in any physical activity. Adults who engage each week in 150 minutes of moderate to vigorous intensity aerobic activity in bouts of at least 10 minutes experience improved health and fitness and reduced risk of several chronic diseases. While 30.4% of all Oklahoma adults from 2005-2010 were not engaging in any physical activity, the rate was higher in Noble County, at 34.7%. This rate should be used cautiously since the measurement error associated with the estimate is very large.

Youth who are regularly active have a better chance of having a healthy adulthood. Children and adolescents should get at least 60 minutes of moderate intensity physical activity most days of the week, preferably every day, and three of those days should include vigorous intensity aerobic activity. Statewide, 56.6% of high school students were physically active most days of the week in 2013.
Diabetes

Type II Diabetes Mellitus is a chronic disease characterized by high levels of sugar (i.e., glucose) in the bloodstream due to the body’s resistance to insulin. If left untreated, serious complications can arise, including heart disease, renal failure, retinopathy, and neuropathies. Several risk factors may increase the likelihood of developing diabetes. Some of these risk factors cannot be changed (e.g., aged 45 years and older, family history). Other risk factors relate to our behaviors, such as prediabetes, overweight/obesity, being physically inactive, and having high blood pressure.19

The prevalence of diabetes has been on the rise in Oklahoma. Slightly more than 10% of Oklahoma adults from 2005-2010 had been told by a health professional that they had diabetes.6 During this same time frame in Noble County, 11.6% of adults had diabetes,6 which is slightly more than the 11.0% of adults cited in the previous County Health Report.9

The American Diabetes Association released a report estimating the total cost of diagnosed diabetes to be $245 billion in the U.S. in 2012.20 This amount includes both direct medical costs and reduced productivity. They estimated the largest component of direct medical costs to be hospital inpatient care. In Noble County, there were 15 hospital discharges attributable to diabetes in 2010, the most recent year that hospital data is available.10 This amounted to $232,447.00 in total charges in 2010 alone, or 0.5% of total hospitalization charges in the county.10

Teen Births

Although births to teen mothers have been declining in recent years,21 Oklahoma still has one of the highest teen birth rates in the country,22 including a high rate of repeat births.23 Pregnant teens are more likely than older pregnant females to experience medical complications, have low educational attainment, and engage in unhealthy behaviors that put their unborn child at risk.24 Children of teen mothers are more likely than children of older mothers to display poor health and social outcomes, such as premature birth, low birth weight, behavioral problems, and abuse and neglect.22 Additionally, infant mortality rates are highest for babies of teen mothers.25

From 2008-2012, Noble County had a teen birth rate of 48.5 births per 1,000 female population aged 15-19 years, which is 7.1% lower than the state rate of 52.2 births per 1,000 female population aged 15-19 years.26 The county rate is 29.0% higher than the rate reported in the previous County Health Report.9

Recent estimates place the cost of teen childbearing in Oklahoma at $190 million in 2008, and this includes only health care and other costs associated with the children, not the mothers.27
Infant Mortality

The infant mortality rate (IMR) is an important indicator of the health of a nation, and is also a reflection of maternal health, accessibility and quality of primary health care, and the availability of supportive services in the community. The leading causes of infant death include congenital malformations (i.e., medical conditions present at birth), disorders related to short gestation (fewer than 37 weeks of pregnancy completed) and low birth weight (less than 5 lbs., 8 oz.), and Sudden Infant Death Syndrome (SIDS). Oklahoma’s IMR has declined 12.8% from its recent high of 8.6 deaths per 1,000 live births in 2006 to 7.5 deaths per 1,000 live births in 2012. However, the rate is still significantly higher than the national (preliminary) rate of 6.05 infant deaths per 1,000 live births in 2011. While organizations across Oklahoma have been working together to reduce infant mortality as part of the Preparing for a Lifetime, It’s Everyone’s Responsibility initiative, there is still much work to do.

Racial disparities exist in IMR, with rates among Oklahoma’s Black/African American infants being more than double the rates of White and Asian/Pacific Island infants. The IMR for Black/African American infants declined between 2003-2007 and 2008-2012 (16.4 to 14.6, respectively), but is still extremely high.

From 2008-2012, the overall IMR for Noble County was 9.7 deaths per 1,000 live births. This rate is 29% higher than the state rate of 7.5 deaths per 1,000 live births and 73% higher than the county rate from 2002-2006. The IMR in Noble County accounted for 525 years of potential life lost based on an average age of death in Oklahoma of 75 years.

Receiving timely prenatal care is believed to reduce the risk of maternal and infant sickness and death as well as preterm delivery and low birth weight. From 2008-2012, 73.7% of women who had a live birth in Noble County accessed prenatal care during the first trimester of their pregnancy.

Low Birth Weight

Low birth weight and preterm births together are the second leading cause of death among children less than 1 year of age. Low birth weight infants are more at risk of health problems compared to infants born of normal weight, including infection, gastrointestinal problems, delayed motor and social development, and learning disabilities. Low birth weight infants may also be at higher risk of high blood pressure, diabetes, and heart disease later in life.

The percentage of Oklahoma babies born at low birth weight (i.e., weighing fewer than 5 pounds and 8 ounces, or 2500 grams) was 8.3% across 2008-2012. This rate is similar to the latest national data (8.2% from 2007-2011). In Noble County, the rate of low birth weight births was 6.8% from 2008-2012, which is 26% higher than the rate from 2003-2007.

As is seen with infant mortality, the percentage of low birth weight births is higher for Black/African American babies (14.1%) than babies of other races (White: 7.8%; American Indian: 7.3%; Asian/Pacific Island: 7.4%).
Injury and Violence

Unintentional injury is the 4th leading cause of death in Oklahoma, and the leading cause of death among individuals aged 5-44 years. In 2010, the most recent year that data are publicly available, injuries accounted for almost $1.4 billion of Oklahoma’s hospital inpatient charges, or almost $34,000 per discharge. This equates to more than 10% of total inpatient charges in 2010, and does not consider other related medical expenses or lost productivity.

In Noble County, unintentional injury is the 5th leading cause of death at 42.1 deaths per 100,000 population. The county rate is lower than the rate of 67.8 which was reported in the previous County Health Report. The current rate is lower than the state rate of 58.7 deaths per 100,000 population.

Motor-vehicle accidents account for 37% of Noble County’s unintentional injury deaths per 100,000 population, resulting in an estimated cost of $14.2 million in 2011. This cost includes wage and productivity losses, medical expenses, administrative expenses, motor vehicle damage, and employers’ uninsured costs ($1.42 million per death).

Violence-related deaths (suicide and homicide) are also leading causes of death in Oklahoma. Noble County’s suicide rate of 9.1 deaths per 100,000 population is 45% lower than the state rate of 16.6 deaths per 100,000 population. There were fewer than 5 deaths attributed to homicide in Noble County from 2008-2012, thus not enabling the reporting of a rate.

Tobacco Use Prevention

While smoking rates continue to decline in the United States, tobacco is still the leading contributor of preventable deaths in the United States, resulting in 80-90% of lung cancer deaths, 90% of deaths from chronic lower respiratory disease, and increasing risk of coronary heart disease and stroke deaths. Oklahoma has consistently had one of the highest rates of adult smoking in the country, with an estimated 23.3% of Oklahoma adults being smokers in 2012. While this rate is higher than the national rate of 19.6%, it represents a significant decline from Oklahoma’s 2011 rate of 26.1%. Total cigarette sales have remained stable the last three years (at about 71 packs per capita, each year from 2010 through 2012), but have declined from 86.7 packs per capita in 2008 that was reported in the previous County Health Report.

Across 2005-2010 in Noble County, 28.0% of adults were smokers. This rate should be used cautiously, however, since the measurement error associated with the estimate is large. Given this rate, health care costs associated with smoking were approximately $51.2 million in Noble County.

Of concern are other types of tobacco use, such as smokeless tobacco and now e-cigarettes. Almost 7% of Oklahoma adults use smokeless tobacco products (6.9% in 2011 and 6.7% in 2012), with almost 70% of smokeless tobacco users also being smokers. Data are still being gathered about e-cigarettes, but their usage has increased among adults as well as middle and high school students nationally.

Notes:

*Death rate is age-adjusted to the 2000 U.S. standard population;
†Data are not available in the state or county because data are collected using a different methodology and thus are not comparable to the national rates and targets established by Healthy People 2020.
§The most recent data available from CDC WONDER Natality Data shows that 73.7%³ of women having live births in 2011 received prenatal care within the first three months of pregnancy. Not all states collect prenatal care information on the birth certificate.

Total Annual Cost* for Noble County:

$34,962,371

*Total cost is the minimum cost to the county for health care related spending for the causes listed above in 2010. Other health maladies, and costs unaccounted for in this report may increase the total annual cost per county.
Oklahoma currently has 68 county health departments and two independent city-county health departments serving 77 counties. Each department offers a variety of services, such as immunizations, family planning, maternity education, well-baby clinics, adolescent health clinics, hearing & speech services, child developmental services, environmental health, and the SoonerStart program. Additionally, many county health departments participate in health education and community development services throughout their county. All county health departments in Oklahoma utilize the Public Health Oklahoma Client Information System (PHOCIS) to track an overview of the services provided to each citizen. In addition, PHOCIS contains a population-based module (POPS) that houses information about community-based events in which health department employees are involved. The information on this page is an accounting of services provided within the county health department and throughout the county.

The Oklahoma Turning Point Initiative is public health improvement in action. The success of the Turning Point process involves a partnership between the state and county departments of health, local communities, and policy-makers. The Oklahoma Turning Point engine is fueled by a community-based decision making process whereby local communities tap into the capacities, strengths, and vision of their citizens to create and promote positive, sustainable changes in the public health system, and the public’s health.

We are at a cross roads in our state and in Noble County. Please come and be part of the solutions that will lead Oklahoma and Noble County to becoming a healthy place to live, work and learn.
